Elevator Pitch

Hello, I'm Bahar. I'm a Computer Science student at the University of North Texas and have a special interest in Artificial Intelligence and Natural Language Processing.

During the summer, in my role at Junius Tech, I was involved in data collection, preprocessing, and model training for text classification models. During this time, I had practical experience with teamwork, algorithm development, and optimization of the models.

Before that, I was a Web Development Intern at Mentor Amazon Company, where I created social media management, digital marketing, and AI-powered content creation projects. In doing so, I learned to use technology both technically and creatively.

Also, as part of my AI Podcast Generator Website project, a team and I developed a full web application that converts articles into podcasts to hear. My project has given me an active role as a participant in every phase of the software development life cycle.

In the future, I would like to be engaged in working on projects that make human-computer interactions more intelligent in an innovative environment such as Google, and I would like to be an expert in this field.
